

Genie Room and AI Assistant Governance Policy

MT&T Corporation - Effective Date: January 1, 2026

Classification: INTERNAL - CONFIDENTIAL

Document Version: 2.1 | Last Updated: March 15, 2026

1. Purpose

This policy establishes governance requirements for Databricks Genie rooms and AI-powered assistants used within MT&T Corporation. It ensures that natural language analytics tools are deployed responsibly with appropriate data access controls, usage monitoring, and quality assurance.

2. Genie Room Provisioning

New Genie rooms must be requested through the AI Governance Portal and approved by: The data owner(s) of the underlying tables, The workspace administrator, The AI Governance team (for rooms accessing system tables or cross-functional data).

Each Genie room must have a designated owner responsible for maintaining table configurations, monitoring usage, and ensuring data accuracy. Genie rooms must use a dedicated SQL warehouse with appropriate sizing based on expected usage. The AI Governance Q&A room (space ID: 01f1336d23c21dbeaf01c8b966940ff8) serves as the reference implementation for governance-focused Genie rooms.

3. Data Access Controls for Genie Rooms

Genie rooms inherit Unity Catalog permissions. Users can only query data they have been granted SELECT access to. Genie rooms must NOT be configured with tables containing raw PII, unmasked financial data, or employee HR records unless dynamic data masking is applied.

The `system.access.assistant_events` table tracks all Genie room interactions. This data is surfaced in the `v_assistant_genie_usage` view and the AI Governance Dashboard's overview section. Genie room owners must review usage patterns monthly to ensure appropriate data access.

4. Usage Monitoring and Limits

Genie room usage is monitored through the `v_assistant_genie_usage` view which tracks: Daily event counts per user and user agent, Peak usage hours and patterns, Active vs inactive Genie rooms, User adoption and engagement metrics.

Usage limits may be applied to prevent excessive costs: Maximum 500 queries per user per day for standard Genie rooms, Maximum 50 concurrent users per Genie room, Queries exceeding 5 minutes execution time must be optimized or moved to scheduled jobs, Genie rooms inactive for 60 days must be reviewed for decommissioning.

5. Quality Assurance

Genie room responses are non-deterministic and must be treated as analytical suggestions, not authoritative answers. Critical business decisions must not be based solely on Genie room output without human verification.

Genie room owners must periodically test curated questions to ensure accuracy. Sample questions should be updated quarterly to reflect current business needs. Feedback mechanisms must be in place for users to report inaccurate or misleading responses.

6. Compliance Requirements

Genie room conversations may contain sensitive business information. Conversation logs must be retained for 90 days for audit purposes. Users must be informed that their Genie room interactions are logged and monitored.

Genie rooms used for regulatory reporting or compliance analysis must be validated by the Compliance team before deployment. Output from these rooms must be cross-referenced with source data before inclusion in regulatory submissions.
